1 Namespace Index

1.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

access	2
name	2

2 Class Index

2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

name.AllNames	5
name.FullName	8
project.Match	9
player.Player	13

project.Project	14
access.Read	16

3 Namespace Documentation

3.1 access Namespace Reference

Classes

- class [Read](#)

Functions

- def [addH](#) ()

Variables

- list [files](#) = []
List of all the CSV files need to be preprocessed.

3.1.1 Detailed Description

```
@file
```

3.1.2 Function Documentation

3.1.2.1 addH()

```
def access.addH ( )
```

It will add header at the first row to the CSVs generated
Such as: "Player Name" , "Team" , "Run scored" etc..

3.2 name Namespace Reference

Classes

- class [AllNames](#)
- class [FullName](#)

Functions

- def [get_initials](#) (s)
Function that returns the initials of the name passed as argument.
- def [get_small](#) (s)
Function that returns the list of all small characters in a person's name.
- def [LCS](#) (s1, s2)
Function that returns the length of the longest common subsequence (LCS) between two strings.
- def [ED](#) (s1, s2)
Function that returns the edit distance between two strings, i.e.

Variables

- string **allcsv** = "allcsv.txt"
- string **dream11** = "dream11.txt"
- **n** = [AllNames](#)(dream11, allcsv)

3.2.1 Detailed Description

@file File Documentation

3.2.2 Function Documentation

3.2.2.1 ED()

```
def name.ED (  
    s1,  
    s2 )
```

Function that returns the edit distance between two strings, i.e.

The minimum number of insertions, deletions, and replacements to be done on one string to convert it to the other.

Parameters

<i>s1</i>	First String
<i>s2</i>	Second String

Returns

Edit distance between the two strings.

3.2.2.2 `get_initials()`

```
def name.get_initials (
    s )
```

Function that returns the initials of the name passed as argument.

Parameters

<code>s</code>	Name passed as string to the function
----------------	---------------------------------------

3.2.2.3 `get_small()`

```
def name.get_small (
    s )
```

Function that returns the list of all small characters in a person's name.

Parameters

<code>s</code>	Name passed as string to the function
----------------	---------------------------------------

3.2.2.4 `LCS()`

```
def name.LCS (
    s1,
    s2 )
```

Function that returns the length of the longest common subsequence (LCS) between two strings.

LCS can be used as a heuristic to determine how similar two names are.

Parameters

<code>s1</code>	First string
<code>s2</code>	Second string

Returns

Length of the longest common subsequence.

4 Class Documentation

4.1 `name.AllNames` Class Reference

Public Member Functions

- `def __init__ (self, first, second)`
Constructor that defines the players playing in the match, and the list of all players in the dataset to which these names are to be mapped.
- `def __init__ (self, dream11, allcsv)`

Constructor that opens files where the list of players playing in a match are stored, and the list of all names contained in the dataset.

- def `get_players` (self)
- def `print_all_players` (self)
- def `mapped_player` (self, player)

Given a particular player with name given as per `Dream11`, this function determines what the player's name is most likely to be in the dataset.

- def `all_players` (self)

Public Attributes

- `first`

List of names of players playing in that match.

- `second`

List of names of players in the dataset.

- `dream11`

File object of the file containing the players playing in this match.

- `allcsv`

File object of the file containing the players in the entire dataset.

4.1.1 Detailed Description

Class that determines the names of players playing in a match with the name of the corresponding player in the

4.1.2 Constructor & Destructor Documentation

4.1.2.1 `__init__()` [1/2]

```
def name.AllNames.__init__ (
    self,
    first,
    second )
```

Constructor that defines the players playing in the match, and the list of all players in the dataset to which these names are to be mapped.

Parameters

<code>first</code>	List of all names playing in the match.
<code>second</code>	List of all names of players in the dataset.

4.1.2.2 `__init__()` [2/2]

```
def name.AllNames.__init__ (
    self,
```

```
dream11,  
allcsv )
```

Constructor that opens files where the list of players playing in a match are stored, and the list of all names contained in the dataset.

Parameters

<i>dream11</i>	Name of file containing names of players playing in the match.
<i>allcsv</i>	Name of file containing names of players contained in the dataset.

4.1.3 Member Function Documentation

4.1.3.1 all_players()

```
def name.AllNames.all_players (  
    self )
```

Determines the names of all the players playing in the match by mapping it to the dataset names. Uses the func

4.1.3.2 get_players()

```
def name.AllNames.get_players (  
    self )
```

Using the file objects of self, this function populates the list `''self.first''` and `''self.second''`.

4.1.3.3 mapped_player()

```
def name.AllNames.mapped_player (  
    self,  
    player )
```

Given a particular player with name given as per Dream11, this function determines what the player's name is most likely to be in the dataset.

Parameters

<i>player</i>	FullName object of a player playing in the match. The name is given as per Dream11 nomenclature.
---------------	--

4.1.3.4 print_all_players()

```
def name.AllNames.print_all_players (
    self )
```

Function simply prints the set of players playing in the match, and the set of players in the dataset. Used in

4.1.4 Member Data Documentation

4.1.4.1 allcsv

```
name.AllNames.allcsv
```

File object of the file containing the players in the entire dataset.

4.1.4.2 dream11

```
name.AllNames.dream11
```

File object of the file containing the players playing in this match.

4.1.4.3 first

```
name.AllNames.first
```

List of names of players playing in that match.

Nomenclature is defined by Dream11 website.

4.1.4.4 second

```
name.AllNames.second
```

List of names of players in the dataset.

This nomenclature is independant of Dream11.

The documentation for this class was generated from the following file:

- name.py

4.2 name.FullName Class Reference

Public Member Functions

- def [__init__](#) (self, name)
Constructor used to initialize a player's full name.

Public Attributes

- [caps](#)
Contains the list of capital letters (initials) in a person's name.
- [small](#)
Contains the list of small letters in a person's name.
- [fullname](#)
Contains the name of the person directly.

4.2.1 Detailed Description

Class that contains information related to an individuals name. This information can be used to determine what

4.2.2 Constructor & Destructor Documentation**4.2.2.1 __init__()**

```
def name.FullName.__init__ (
    self,
    name )
```

Constructor used to initialize a player's full name.

Parameters

<i>name</i>	Player's name passed as a simple string
-------------	---

The documentation for this class was generated from the following file:

- name.py

4.3 project.Match Class Reference**Public Member Functions**

- [def __init__](#) (self, [url](#), [tournament](#), [first](#), [second](#), [time](#), [fimg](#), [simg](#))
Constructor which will create the match object.
- [def print_match](#) (self)

Public Attributes

- [url](#)
Stores the url of the corresponding match on the Dream11 website.
- [tournament](#)
Stores the url of the corresponding match on the Dream11 website.

- [first](#)
Stores the name of the first team of the cricket match.
- [second](#)
Stores the name of the second team of the cricket match.
- [time](#)
Time left till the match commences.
- [fimg](#)
Url of the logo of the first team.
- [simg](#)
Url of the logo of the second team.
- [batsmen](#)
List of batsmen participating in the match.
- [bowlers](#)
List of bowlers participating in the match.
- [wk](#)
List of wicket keepers in the match.
- [ar](#)
List of all rounders in the match.
- **data**

4.3.1 Detailed Description

Match class

This is a match class which will store upcoming match data fetched from the Dream11 website.

4.3.2 Constructor & Destructor Documentation

4.3.2.1 `__init__()`

```
def project.Match.__init__(
    self,
    url,
    tournament,
    first,
    second,
    time,
    fimg,
    simg )
```

Constructor which will create the match object.

Data for some attributes like batsmen will be fetched later.

Parameters

<i>url</i>	url of perticular match.
<i>tournament</i>	list of tournament.
<i>first</i>	Name of first team.
<i>second</i>	Name of second team.
<i>time</i>	Time remaining to select team.
<i>fimg</i>	Flag image of first team.
<i>simg</i>	Flag image of second team.

4.3.3 Member Function Documentation

4.3.3.1 print_match()

```
def project.Match.print_match (
    self )
```

This method will print the match data of upcoming matches. The printing will be done in html format for ease of use.

4.3.4 Member Data Documentation

4.3.4.1 ar

```
project.Match.ar
```

List of all rounders in the match.

4.3.4.2 batsmen

```
project.Match.batsmen
```

List of batsmen participating in the match.

4.3.4.3 bowlers

```
project.Match.bowlers
```

List of bowlers participating in the match.

4.3.4.4 fimg

```
project.Match.fimg
```

Url of the logo of the first team.

4.3.4.5 first

```
project.Match.first
```

Stores the name of the first team of the cricket match.

4.3.4.6 second

```
project.Match.second
```

Stores the name of the second team of the cricket match.

4.3.4.7 simg

```
project.Match.simg
```

Url of the logo of the second team.

4.3.4.8 time

```
project.Match.time
```

Time left till the match commences.

4.3.4.9 tournament

```
project.Match.tournament
```

Stores the url of the corresponding match on the Dream11 website.

4.3.4.10 url

```
project.Match.url
```

Stores the url of the corresponding match on the Dream11 website.

4.3.4.11 wk

```
project.Match.wk
```

List of wicket keepers in the match.

The documentation for this class was generated from the following file:

- project.py

4.4 player.Player Class Reference

Public Member Functions

- `def __init__ (self, name, credit)`
Constructor which will create the [Player](#) object.
- `def print_pl (self)`
- `def open_match (p, match)`
This method will open the perticular match in web browser and fetch the players information and credits from the html returned by the webdriver.

Public Attributes

- `name`
Stores player name of some match.
- `credit`
Stores credit given to individual player.

4.4.1 Detailed Description

Player class

This is a player class which will store details of players playing in the perticular match.

4.4.2 Constructor & Destructor Documentation

4.4.2.1 __init__()

```
def player.Player.__init__ (
    self,
    name,
    credit )
```

Constructor which will create the [Player](#) object.

Initialising some variables.

Parameters

<i>name</i>	Name of players.
<i>credit</i>	Individual player credit.

4.4.3 Member Function Documentation

4.4.3.1 open_match()

```
def player.Player.open_match (
    p,
    match )
```

This method will open the particular match in web browser and fetch the players information and credits from the html returned by the webdriver.

Parameters

<i>p</i>	Object of class Project
<i>match</i>	Object of class project

4.4.3.2 print_pl()

```
def player.Player.print_pl (
    self )
```

This method will print the player data of particular match. The printing will be done in html format for ease

4.4.4 Member Data Documentation

4.4.4.1 credit

```
player.Player.credit
```

Stores credit given to individual player.

4.4.4.2 name

```
player.Player.name
```

Stores player name of some match.

The documentation for this class was generated from the following file:

- player.py

4.5 project.Project Class Reference

Public Member Functions

- def [__init__](#) (self, [url](#))
Constructor which will create the [Project](#) object.
- def [make_request](#) (self)
- def [parse](#) (self)

Public Attributes

- [url](#)
Stores url that will open in webbrowser.
- [matches](#)
Stores the details of matches that are live now.
- [driver](#)
This will provide connectivity with the browser.

4.5.1 Detailed Description

Project Class

This will open the required website in a browser and will parse the webpage to get required data.

4.5.2 Constructor & Destructor Documentation**4.5.2.1 __init__()**

```
def project.Project.__init__ (
    self,
    url )
```

Constructor which will create the [Project](#) object.

Initialising required variable.

Parameters

<i>url</i>	url to open in webbrowser.
------------	----------------------------

4.5.3 Member Function Documentation**4.5.3.1 make_request()**

```
def project.Project.make_request (
    self )
```

Provide connectivity with the browser using webdriver.

4.5.3.2 parse()

```
def project.Project.parse (
    self )
```

This parses the opened webpage and generates the data in a useable form.

4.5.4 Member Data Documentation

4.5.4.1 driver

```
project.Project.driver
```

This will provide connectivity with the browser.

4.5.4.2 matches

```
project.Project.matches
```

Stores the details of matches that are live now.

4.5.4.3 url

```
project.Project.url
```

Stores url that will open in webbrowser.

The documentation for this class was generated from the following file:

- project.py

4.6 access.Read Class Reference

Public Member Functions

- def `__init__` (self, filename)
Constructor to initialize the filename of the CSV file associated with the object Filename of the CSV file of the match.
- def `read_file` (self)
- def `print_file` (self)
- def `gen_csv` (self)
- def `calculateScore` (self)

Public Attributes

- **filename**
- [player_details](#)
Matrix containing per ball data of the match.
- [match_details](#)
Matrix containing match details of the match.
- [data](#)
Contains data of the match in YAML format, to get extra information of the match wrt the players who have caught/run out batsmen.
- [batsmen](#)
Set of batsmen playing in the match, initialized to empty.
- [bowlers](#)
Set of bowlers playing in the match, initialized to empty.
- [fielder](#)
Set of the fielders in the match that have taken a catch or did run out, initialized to empty.
- [teamplayers](#)
Set of all the players playing in a match, initialized to empty.
- [year_list](#)
List of years from when the T20 match is being played.
- [year](#)
Year of the ongoing match.
- [bowler_dict](#)
Dictionary that contains bowler's detail of a particular match.
- [batsmen_dict](#)
Dictionary that contains batsman's detail of a particular match.
- [fielder_dict](#)
Dictionary that contains fielder's detail of a particular match.

4.6.1 Detailed Description

Read Class

Responsible for opening and preprocessing a single file

This class is will open an instance of a single CSV file of a match, preprocess it and create/append to CSV fi

4.6.2 Constructor & Destructor Documentation

4.6.2.1 __init__()

```
def access.Read.__init__(
    self,
    filename )
```

Constructor to initialize the filename of the CSV file associated with the object Filename of the CSV file of the match.

,

Parameters

<i>filename</i>	list off al the files in current directory
-----------------	--

4.6.3 Member Function Documentation

4.6.3.1 calculateScore()

```
def access.Read.calculateScore (  
    self )
```

Member function to calculate the score of each player according to the Dream 11's Fantasy Cricket Point System

4.6.3.2 gen_csv()

```
def access.Read.gen_csv (  
    self )
```

Member Function associated with preprocessing the tables and generating a CSV for each player playing in the m

4.6.3.3 print_file()

```
def access.Read.print_file (  
    self )
```

Member function to print details of each match ball by ball.

4.6.3.4 read_file()

```
def access.Read.read_file (  
    self )
```

Member function to initialize a few variables related to the match, like team names, venue of the match, etc. Function also reads the CSV/YAML file and stores it into two tables in the memory, *player_details*, and *match_d*

4.6.4 Member Data Documentation

4.6.4.1 data

```
access.Read.data
```

Contains data of the match in YAML format, to get extra information of the match wrt the players who have caught/run out batsmen.

4.6.4.2 match_details

```
access.Read.match_details
```

Matrix containing match details of the match.

4.6.4.3 player_details

```
access.Read.player_details
```

Matrix containing per ball data of the match.

The documentation for this class was generated from the following file:

- access.py
